Help File

Github repository https://github.com/ishalazo/cs4013Project

The project can be compiled from the command line as a usual java project would using javac. The project can be run on the command line or be run through a GUI. To run on CLI run the CLI.java file, to run on the GUI launch the GUI.java file. To properly run the GUI JavaFX libraries are required. These can be found on GitHub under External JARs. Note also that the project uses OpenCSV to deal with CSV files. Again the JAR files can be found under the External JARs folder on GitHub. If attempting to generate the Javadocs for the project files from the command line the JARs must be accounted for otherwise the generation of the documentation will fail, it may be necessary to have additional flags in the javadoc command.

NB
Please enure that in all csv files being used that there is a blank after the last row of data. If not there will be errors.
